(Signature)

1 **I. RELATED PATENT APPLICATION**

2 This patent application is a continuation-in-part patent application of copending U.S.  
3 Patent Application, Serial Number 10/219,656, filed August 14, 2002.

4 **II. FIELD OF THE INVENTION**

5 The present invention relates to the ultra violet irradiation of blood apparatus and,  
6 more particularly, to the modification of viruses and bacteria in the body without  
7 contamination using a unique method and cuvette apparatus.

8 **III. BACKGROUND AND DESCRIPTION OF THE PRIOR ART**

9 In the past, others have attempted to eradicate viruses and bacteria using a mercury  
10 vapor lamp and an irradiation chamber. This combination, however, presented a number of  
11 problems. Since the mercury vapor lamp is made with contaminating materials, the irradiation  
12 chamber could become contaminated. As a result, this type of lamp has been restricted by the  
13 Federal Drug Administration from use in the treatment of fluids in this manner. Also, as the

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 2**

1 irradiation chamber is permanently secured to the unit, sterilization of the chamber is a very  
2 difficult, time consuming task.

3 In an attempt to overcome this problem, a number of patents have been issued that  
4 disclose apparatus and methods for the irradiation of blood or bodily fluids. As listed below  
5 in the order of issuance, these are:

6	<u>Inventor</u>	<u>Issued</u>	<u>Title of Patent</u>	<u>U. S. Patent No.</u>
7	Morris	09/14/99	Blood Product Irradiation Device	5,951,509
8			Incorporating Agitation

19	Hazelrigg	07/08/75	Device For Irradiating Fluids	3,894,236

20 Of these patents, the most relevant are: U.S. Patent 5,770,147 to Muller entitled  
21 "Apparatus For The Irradiation of Body Fluids By Ultraviolet Light" ("Muller"); U.S. Patent  
22 5,429,594 to Castle entitled "Extra-Corporeal Blood Access, Sensing, and Radiation Methods  
23 And Apparatus" ("Castle"); U.S. Patent 5,304,113 to Sieber entitled "Method of Eradicating

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 3**

1 Infectious Biological Contaminants" ("Sieber"); and U.S. Patent 5,951,509 to Morris entitled  
2 "Blood Product Irradiation Device Incorporating Agitation" ("Morris").

3 Muller ('147) discloses an apparatus for the irradiation of body fluids by ultraviolet  
4 light in a containment. In one embodiment, the containment consists of a cuvette, an adaptor,  
5 a drive motor, and an Ultraviolet lamp. The cuvette, upon being filled with blood removed  
6 from a patient, is fitted into the containment and engaged with the adaptor. The cuvette is  
7 then rotated by the drive motor and exposed to the Ultraviolet radiation uniformly. The  
8 cuvette also includes flow baffles to provide additional turbulence to generate a radial flow  
9 of the blood towards the Ultraviolet radiation. Upon completion of the radiation, the cuvette  
10 is disengaged from the containment, the irradiated blood is removed from the cuvette, and  
11 then returned to the patient.

12 Castle ('594) discloses a method and apparatus for extra corporeal access to blood for  
13 analysis and treatment of the blood. In use, the apparatus pumps blood from a patient  
14 through an outlet line and then returns the blood back to the patient through an inlet line.  
15 During this extra corporeal flow of the blood, the outlet line and the inlet line each have  
16 access ports in which the blood may be either analyzed or treated. Any treatment of the blood  
17 consists of energy or radiation and includes ultrasonic waves.

18 Sieber ('113) discloses a method to eradicate infectious biological contaminants such  
19 as the human immunodeficiency virus. The method consists of withdrawing the blood from  
20 a patient using a pump, adding anti-coagulants to the blood, an occluded vein sensor to

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, R bert**

**PAGE : 4**

1 prevent or inhibit the generation or existence of bubbles in the flow of the blood, inserting a  
2 photosensitizing agent, an irradiation chamber which consists of visible light to activate the  
3 photosensitive agent, and then returning the erradicated blood to the patient.

4 Morris ('509) discloses an apparatus for treating human blood by irradiation. In use,  
5 blood is withdrawn from a patient and supplemented by an anti-coagulant solution. The  
6 blood is then separated into two portions by a cell separator, such as a centrifuge, with one  
7 portion being directed into a bag for irradiation and another portion either being held in  
8 storage or returned to the patient. Upon a predetermined volume of blood accumulated into  
9 the bag, the bag is placed within an irradiation apparatus. The irradiation apparatus consists  
10 of an upper lamp array and a lower lamp array of ultraviolet individual lamps and the bag is  
11 placed in the middle of the upper lamp array and the lower lamp array to irradiate the blood  
12 prior to being returned to the patient.

13 The combination of the above patents reveals that there exist several ways to irradiate  
14 blood from a patient. Among the common disclosure of these patents is that blood is  
15 removed from a patient, the blood is irradiated using ultraviolet light to kill contaminants and  
16 viruses, and the irradiated blood is then returned to the patient. Each patent is distinguishable  
17 in that it introduces additional steps during this process and/or accomplishes the process in  
18 a different manner. However, none of the patents disclose or teach a closed system with the  
19 ability to remove contaminated blood from a patient in one channel, effectively irradiate the  
20 blood twice in the same cuvette using multiple ultraviolet light sources, and then return the

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 5**

1 irradiated blood back to the patient using the same channel, thereby, providing an effective  
2 modification of the viruses and bacteria in the blood in an attempt to eradicate the same.  
3 Thus, there is a need and there has never been disclosed an apparatus and method that solves  
4 the problems presented by today's devices and is as effective as Applicant's unique invention.

5 **III. OBJECTS OF THE INVENTION**

6 It is the primary object of the present invention to modify viruses and bacteria in the  
7 body in an attempt to eradicate the same. A related object of the present invention is to  
8 effectively modify the viruses and bacteria using a minimal number of modalities or processes.  
9 Another related object of the present invention is to have a positive impact on the condition.  
10 A further related object of the present invention is to reduce the blood count or PCR within  
11 the body.

12 Another object of the invention is to provide an apparatus that uses pure safe  
13 ultraviolet light and that is calibrated to the required or desired frequencies. A related object  
14 of the invention is to use the ultraviolet light for the irradiation of the blood.

15 Another object of the invention is to eliminate the contamination through the use of  
16 personal cuvettes. A related object of the invention is to provide a cuvette which is smaller  
17 and more compact making it suitable as a portable unit for patients who are unable to attend  
18 or fulfill scheduled appointments at hospitals, outpatient health care clinics, etc...

19 Another object of the invention is to provide an apparatus and system that is  
20 inexpensive to manufacture. A related object of the invention is to provide a system that is

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 6**

1 safe and easy to use.

2 Other objects of the present invention will become more apparent to persons having  
3 ordinary skill in the art to which the present invention pertains from the following description  
4 taken in conjunction with the accompanying drawings.

5 **IV. SUMMARY OF THE INVENTION**

6 The present invention is an apparatus and method for the modification of viruses and  
7 bacteria in the body. The apparatus consists of a cuvette, an irradiation station, two  
8 ultraviolet light sources, a peristaltic pump, and a bottle which are all systematically situated  
9 with respect to a housing and a cover. A plurality of power control switches controls the  
10 operation of the apparatus. This includes an on/off power switch, an on/off pump control, and  
11 ultraviolet light control switches. Timers are provided to regulate the time period the cuvette  
12 is exposed to the ultraviolet radiation within the irradiation station from the two ultraviolet  
13 light sources. The cover is also provided to enable the cuvette to be used and exposed to  
14 ultraviolet radiation within an enclosed environment.

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 7**

1 **V. BRIEF DESCRIPTION OF THE DRAWINGS**

2 The Description of the Preferred Embodiment will be better understood with reference  
3 to the following figures:

4 Figure 1 is a perspective view of the irradiation apparatus of Applicant's invention for  
5 the eradication of viruses and bacteria within the body.

6 Figure 2 is a top planar view, with portions removed, illustrating the control features  
7 of the apparatus in relation to the cuvette.

8 Figure 3 is a side planar view, with portions removed, illustrating the ultra violet  
9 radiation of the cuvette.

10 Figure 4 is an electrical schematic diagram of the apparatus.

11 **VI. DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT**

12 Turning first to Figure 1, there is illustrated a blood irradiation apparatus 10. The  
13 blood irradiation apparatus 10 consists of a housing 12 and a cover 14. In the preferred  
14 embodiment, the housing 12 and the cover 14 are made from metal (e.g., similar to that used  
15 for storage cabinets). Alternatively, it is contemplated that the housing 12 and the cover 14  
16 may be made of a durable plastic material. Situated along the exterior surface of the housing  
17 12 is an irradiation station 16, a pump 18, a plurality of power control switches 20, and a pair  
18 of timers 22 and 23. Situated at a position adjacent to the housing 12 is a bottle 34.  
19 Alternatively, any other sterilized bottle 34 may be used provided the pump 18 is used during  
20 the process as described later in the specification.

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 8**

1           The irradiation station 16 consists of a lens or faceplate 24 and brackets or sides 26.  
2           The faceplate 24 is a flat surface and is made of a clear quartz crystal material. The faceplate  
3           24 has a width 28 (Figure 2) and a length 30 (Figure 2). In the preferred embodiment, the  
4           width 28 is approximately one and one-eighth of an inch (1 1/8") and the length 30 is  
5           approximately five and one-quarter of an inch (5 1/4"). The purpose of the faceplate 24 is  
6           twofold: (1) to coact with the brackets or sides 26 to retain a cuvette 32 in an elongated, flat  
7           position, and (2) to facilitate the ultraviolet irradiation of the cuvette 32 as described in  
8           further detail herein and, in particular, with respect to Figure 3.

9           In the preferred embodiment, the cuvette 32 is preferably made of a quartz crystal  
10          material and is placed within the irradiation station 16. Alternatively, it is contemplated that  
11          the cuvette 32 may be made of a durable plastic material. The cuvette 32 is preferably laid  
12          flat against the faceplate 24 and displaced evenly across the surface area of the faceplate 24.  
13          In this manner, the largest cross section of liquid or blood passing through the cuvette 32 is  
14          ultimately exposed to the ultraviolet light radiation. After the cuvette 32 is used for the  
15          treatment of fluid, the cuvette 32 can be disposed of and replaced with a new, unused cuvette  
16          32. This effectively eliminates all chances of any kind of contamination in subsequent  
17          modalities or processes.

18          The pump 18 is preferably a peristaltic pump or the commonly referred to "paddle"  
19          pump. The pump 18 consists of a wheel 46 (Figure 2), a jaw 48 (Figure 2), and a securing  
20          means 50 (Figure 2) for securing the jaw 48 in relation to the wheel 46. A conduit 52 extends

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 9**

1 from the cuvette 32 through the pump 18 and ends at the bottle 34. In use, the conduit 52  
2 contains the matter such as liquid or blood from the body. While transporting the liquid or  
3 blood from the body through the blood irradiation apparatus 10, the conduit 52 is placed  
4 between the wheel 46 and the jaw 48. The pump 18, using the wheel 46 which has nubs (not  
5 illustrated) and which are equally spaced around the circumference of the wheel 46, creates  
6 wavelike contractions in the conduit 52 from the pressure of the nubs upon the conduit 52  
7 (i.e., squeezing of the conduit 52) during rotation of the wheel 46. These wavelike  
8 contractions facilitate the transportation of the liquid or blood from the body and through the  
9 blood irradiation apparatus 10.

10 The plurality of power control switches 20 consists of an on/off power switch 36, an  
11 on/off pump control switch 38, and ultraviolet light control switches 40 and 41. The on/off  
12 power switch 36 controls the electrical power of the blood irradiation apparatus 10. A power  
13 cord 42 (Figure 2) provides continuous electrical power source to the blood irradiation  
14 apparatus 10. If the on/off power switch 36 is depressed to the off position, the blood  
15 irradiation apparatus 10 will not be energized and prohibited from operating. If the on/off  
16 power switch 36 is depressed to the on position, the electrical power supplied from the power  
17 cord 42 will permit the operation of the blood irradiation apparatus 10. The on/off power  
18 switch 36 and the power cord 42 is the means for energizing the fluid or blood irradiation  
19 apparatus 10. Likewise, the on/off pump control switch 38 operates in the same manner as  
20 the on/off power switch 36 except that the on/off pump control switch 38 controls the

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 10**

1 operation of the pump 18. The ultraviolet light control switches 40 and 41 also operate in the  
2 same manner as the on/off power switch 36 and the on/off pump control switch 38 by  
3 toggling between an "on" position and an "off" position. In the "on" position, the ultraviolet  
4 light control switches 40 and 41 enable the cuvette 32 to be irradiated with the ultraviolet  
5 light radiation. When the ultraviolet light control switches 40 and 41 are toggled back to the  
6 "off" position, the irradiation of the ultraviolet light on the cuvette 32 is terminated. In the  
7 preferred embodiment, the timers 22 and 23 provide the total amount of time that the cuvette  
8 32 has been exposed to the ultraviolet light radiation from the ultraviolet light sources or, in  
9 other words, allows the user to control or regulate the irradiation time of the liquid or blood.  
10 The plurality of power control switches 20 consisting of the on/off power switch 36, the  
11 on/off pump control switch 38, and the ultraviolet light control switches 40 and 41 is the  
12 means for controlling the operation of the fluid or blood irradiation apparatus 10.

13 The cover 14, during use and the modification process, is in the closed position to  
14 enclose the pump 18, the cuvette 32, and the irradiation station 16. The purpose of the cover  
15 14 is to house one of the ultraviolet light sources and to protect the attendant or others  
16 adjacent to the blood irradiation apparatus 10 from any harmful ultraviolet light radiation  
17 during the modality or process. The cover 14 contains apertures 44 which provide egress for  
18 the conduit 52 transporting the blood to and from the patient through the blood irradiation  
19 apparatus 10. When the cover 14 and/or the blood irradiation apparatus 10 are not being  
20 used, the cover 14 is placed in the open position to permit access to the pump 18 and the

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 11**

1 irradiation station 16 for purposes of servicing these components. For example, with the  
2 cover 14 in the open position, the cuvette 32 may be replaced within the irradiation station  
3 16. The cover 14 is the means for enclosing the cuvette 32 and irradiation station 16 when  
4 the fluid or blood irradiation apparatus 10 is in use for minimizing the escape of ultraviolet  
5 light radiation.

6 Turning to Figure 3, the irradiation of the cuvette 32 is more clearly illustrated.  
7 Located within the housing 12 is a radiation box 54 and an ultraviolet light source 56. The  
8 ultraviolet light source 56 is held into position within the radiation box 54 by holding elements  
9 58a and 58b. Preferably, the ultraviolet light source 56 is aligned parallel to and adjacent to  
10 the cuvette 32 to enable a consistent and uniform irradiation of blood when the blood  
11 irradiation apparatus 10 is in use. The ultraviolet light source 56 is calibrated to different light  
12 transmission band widths. For example, the ultraviolet light source 56 is capable of being  
13 calibrated in each of the UVA, UVB or UVC light band widths or between 40 to 400 nano  
14 meters. The blood irradiation apparatus 10 is more effective by using a pure ultraviolet light  
15 that is calibrated to the right frequencies needed to modify the viruses and/or bacteria. The  
16 timer 23 is beneficial here as it provides the total time that the ultraviolet light source 56 has  
17 been used. This information is useful as the ultraviolet light source 56 should be calibrated  
18 every 1000 hours and replaced every 8000 hours or sooner, if needed. In the preferred  
19 embodiment, the radiation box 54 is removable from the housing 12 to enable the ultraviolet  
20 light source 56 to be calibrated or replaced as desired. The ultraviolet light control switch 41

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 12**

1 controls the operation of the ultraviolet light source 56.

2 Located within a chamber 63 of the cover 14 is another ultraviolet light source 57.

3 The ultraviolet light source 57 is held into position within the chamber 63 by holding elements

4 59a and 59b. The ultraviolet light source 57 is covered by a lens or faceplate 61 to enable the

5 complete passage of ultraviolet light radiation and to prevent any contamination of the cuvette

6 or device in the unlikely event the ultraviolet light source 57 breaks. In the preferred

7 embodiment, the lens 61 is made of a clear quartz crystal material and is substantially the same

8 size as the faceplate 24 for the ultraviolet light source 56.

9 Preferably, when the cover 14 is in the closed position, the ultraviolet light source 57

10 is aligned parallel to and adjacent to the cuvette 32 to enable a consistent and uniform

11 irradiation of blood, from the opposite side of the cuvette 32 to the ultraviolet light source

12 56, when the blood irradiation apparatus 10 is in use. The ultraviolet light source 57 is

13 calibrated to different light transmission band widths. For example, the ultraviolet light source

14 57 is capable of being calibrated in each of the UVA, UVB or UVC light band widths or

15 between 40 to 400 nano meters. The blood irradiation apparatus 10 is more effective by using

16 a pure ultraviolet light that is calibrated to the right frequencies needed to modify the viruses

17 and/or bacteria. The timer 22 is beneficial here as it provides the total time that the ultraviolet

18 light source 57 has been used. This information is useful as the ultraviolet light source 57

19 should be calibrated every 1000 hours and replaced every 8000 hours or sooner, if needed.

20 In the preferred embodiment, when the cover 14 is in the open position, the ultraviolet light

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 13**

1 source 57 is enabled to be calibrated or replaced as desired. The ultraviolet light control  
2 switch 40 controls the operation of the ultraviolet light source 57 and it is powered from a  
3 power cord 47 which is dependent upon the position of the on/off power switch 36.

4 The benefits of using ultraviolet light sources 56 and 57 is that, depending upon the  
5 particular virus or bacteria to be modified, the blood irradiation apparatus 10 may use both  
6 ultraviolet light sources 56 and 57 simultaneously, separately, or any combination thereof  
7 during a treatment. Also, during any treatment of the simultaneous, separate, and or  
8 combination thereof, the ultraviolet light sources 56 and 57 may be calibrated to the same  
9 UVA, UVB, or UVC light band or each may be calibrated to a different light band. For  
10 example, in one nonlimiting treatment, the ultraviolet light source 56 may be calibrated in the  
11 UVC light band while the ultraviolet light source 57 may be calibrated in the UVA light band.  
12 In this manner, the ultraviolet light source 56, through the UVC light band, may modify or  
13 reduce the viral and bacterial load in the blood responsive to this light band while the  
14 ultraviolet light source 57, through the UVA light band, may simultaneously impact a different  
15 viral and bacterial load in the blood that is responsive to this light band which may be present  
16 but not yet discernable or diagnosed. As a result, the combination of ultraviolet light sources  
17 in the blood irradiation apparatus 10 coacts to modify a larger spectrum of viruses and  
18 bacteria; it binds the DNA and, thereby, prevents the viruses and bacteria from reproducing;  
19 it returns the altered viruses and bacteria back into the body and stimulates the body's immune  
20 system to attack not only the altered viruses and bacteria but also viruses and bacteria with

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 14**

1 the same DNA fingerprint; and stimulates the body's immune system to increase the number  
2 of antigen processing cells which seek out and destroy particular cells within the body.

3 In use, liquid or blood is withdrawn by venipuncture from the body through a conduit  
4 52 and into an irradiation chamber or cuvette 32. Once within the cuvette 32, the liquid or  
5 blood is exposed to a controlled amount of ultraviolet light energy from the ultraviolet light  
6 source 56, within the radiation box 54 and through the faceplate 24, and from the ultraviolet  
7 light source 57 from within the cover 14 and through the lens 61. The amount of ultraviolet  
8 light energy is provided in the accepted therapeutic band in order to modify the virus or  
9 bacteria. The liquid or blood continues through to either the peristaltic pump 18 on the way  
10 to the bottle 34 or bypasses the peristaltic pump 18 and goes directly into the ivac bottle 34.  
11 The bottle 34 is the means for receiving the fluid transported and irradiated through the  
12 cuvette 32. If the liquid or blood is being transported from the body through the blood  
13 irradiation apparatus 10 by the pump 18, the liquid or blood will pass through the pump 18  
14 in conduit 52 as it is the pump 18 which is artificially causing the transportation of the liquid  
15 or blood through the system. Alternatively, if the peristaltic pump 18 not being used, an ivac  
16 bottle 34 can be used as it provides its own vacuum to draw the blood from the body at a  
17 controlled rate. The peristaltic pump 18 or ivac bottle 34 is the means for drawing and  
18 transporting the fluid through the cuvette 32. This type of technique is also referred to as the  
19 Knott technique. Using the Knott technique, the liquid or blood will bypass the pump 18 and  
20 be transported directly into the bottle 34.

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 15**

1           In the preferred embodiment, the amount of blood withdrawn from the body is  
2   approximately 1.5cc of blood per pound of body weight with the total amount of blood per  
3   modality or process never exceeding 250cc of blood. The reason is that if more than 250cc  
4   of blood is removed from the body in one process, the blood remaining in the body would not  
5   be at an acceptable, healthy level for the patient. After the desired amount of blood is  
6   transported completely through the blood irradiation apparatus 10 and is contained within the  
7   bottle 34, the bottle 34 is then elevated into the air to a location above the blood irradiation  
8   apparatus 10. Once in this position, the bottle 34 is opened and the blood is permitted to drip  
9   from the bottle 34 to be transferred back through the blood irradiation apparatus 10 and  
10   returned to the body. Depending upon the amount of blood impacted and the desired  
11   retention time, the drip rate from the bottle 34 can be adjusted accordingly. The irradiated  
12   blood leaves the bottle 34 and returns through the cuvette 32 and the irradiation station 16  
13   for a second time and is, once again, exposed or irradiated to a controlled amount of  
14   ultraviolet light energy from the ultraviolet light source 56, within the radiation box 54 and  
15   through the faceplate 24, and from the ultraviolet light source 57 from within the cover 14  
16   and through the lens 61. The liquid or blood then continues back into the body through the  
17   same needle used for withdrawal. This entire process including the bottle 34 and the timers  
18   22 and 23 is the means for returning the fluid back through the cuvette 32 from the bottle 34.  
19   This entire process is considered a single modality and is contained within a closed system  
20   that prohibits the introduction or potential for foreign objects or other contaminants to enter

**UNITED STATES PATENT APPLICATION**

**INVENTION : HEMO-AIDE**

**INVENTOR : Clark, Robert**

**PAGE : 16**

1 the system or adversely affect the procedure. An average procedure takes approximately one  
2 hour and patients can receive, at scheduled times, multiple procedures or as many procedures  
3 as it takes to positively impact the condition. The blood irradiation apparatus 10 is capable  
4 of modifying known viruses and bacterial diseases which includes but is not limited to  
5 septicemias, pneumonias, peritonitis, viral infections including acute and chronic hepatitis,  
6 atypical pneumonias, poliomyelitis, encephalitis, mumps, measles, mononucleosis, herpes. It  
7 is contemplated that the blood irradiation apparatus 10 has positive effects of the diseases  
8 known to man with little or no side effects. Although throughout this disclosure the term  
9 "blood" is used to designate the fluid passed through the apparatus, it is recognized that other  
10 body fluids can also be passed through the apparatus with the same results. Accordingly, the  
11 term "blood" is also meant to encompass any body fluids (i.e., human, animal, etc...) capable  
12 of being irradiated.

13 Thus, there has been provided a blood irradiation apparatus that effectively uses a  
14 closed system to modify viruses and bacteria in the body and provide a positive impact on the  
15 condition while further eliminating contamination from external sources. While the invention  
16 has been described in conjunction with a specific embodiment, it is evident that many  
17 alternatives, modifications and variations will be apparent to those skilled in the art in light  
18 of the foregoing description. Accordingly, it is intended to embrace all such alternatives,  
19 modifications and variations as fall within the spirit and scope of the appended claims.
